

APP NOTICE SDK COMPANION GUIDE

Version 1.0

August 2015

Create an App Notice

Log in to <https://my.ghosteryenterprise.com>. In the Site Notice tab, click "Create/Edit Site Notice". On the "My Site Notices" page, click "New Hover Notice". On the New Notice page, name the notice, choose a domain (high level company domain works fine), and then select a Notice Type – Hover with Explicit Consent or Hover with Implied Consent. **Note: Use only Hover with Explicit Consent or Hover with Implied Consent.**

The image shows a portion of a web form for creating a notice. It includes three labels: "Type:", "Store cookie on sub-domains", and "Position:". To the right of "Type:" is a dropdown menu with three visible options: "Hover with Explicit Consent", "Hover", and "Hover with Implied Consent". The "Hover with Explicit Consent" option is highlighted with a blue background. Two blue arrows point from the "Store cookie on sub-domains" label towards the dropdown menu. Below the dropdown menu, there are two radio button options: "Bottom Left" and "Bottom Right".

Be sure to fill out the required fields for each type of notice in the images below.

After configuring your App Notice, click Save Notice. Note your **cid** and **pid** in the tag preview as these will be required for authentication in the App Notice SDK.
